What are the most suitable computer virus removal softwares? I have been trying to remove the recent Ransomware which has infected numerous computers and files. I need to remove it to safeguard my computer and data. I already have tried using Malwarebytes Anti-malware and others.

When I deleted some recently created registry keys and contents, the message says "malware detected and disinfected" and it takes a few minutes to be completed. My question here is what's the right way to completely erase a recent Ransomware? Should I just delete all the files and registry keys, but should I get any other virus removal softwares? I also tried the Malwarebytes Free and it is still blocked by virus and it says "WARNING: Scanning the drive took longer than 1 second" and it requires a restart. What should I do next? I've been using a free McAfee antivirus, but it won't work. I have a Windows 8, I've removed all files attached to the virus which has definitely blocked McAfee, but it comes back back after some time and blocks again. What should I do next? I can't remove it by "Scan with HDScan". Please help, thank you. What is the software solution from Microsoft to prevent this problem? It is the scenario of a service account (my one) account locked out after multiple unsuccessful attempts to log in. My account is locked out of this specific service account and I can't log in via an account manager. There is no account of the account in question. The log off screen of the service account shows "Account is disabled". If I have administrator privileges on the computer, I can log in normally. I receive a blank screen when an attempt is made to log in to the service account, and the timeout message. However, a password reset screen comes up, but no password is accepted. I think the VMs that were assigned to the service account were deleted and recreated. The VMs were assigned to the service account in error and had been deleted. I attempted to add the account to the assigned groups via the admin GUI and received an error. I have tried to add the account from the CLI as well. My next step is to rename and recreate the VMs assigned to the service account and assign those to my account. I don't think a new VM is needed for every service account. It would be ideal to add b7e8fdf5c8
